

# The World's Hidden Resource

Discover a new Company rich in this "hidden resource" -- poised to hand you generous profits in the coming recovery...

Dear Fellow Investor,

One very extraordinary company is particularly flush with a resource that is thousands of years old. In fact, it's being used to build an immeasurable high-tech empire on a global scale. Its material is found in the world's most simple environments. Moreover the product is being stored both above and below ground. The problem is it is hurting planet earth.

I'm talking about a mission-critical to the world's new x factor "Green Energy", especially during a meltdown of the world's economy and the drastic measures being taken to save planet earth...

That's why the world's most savvy investors and companies have begun outsourcing their garbage.

That's why the world's most advanced manufacturers and engineers are hardworking to produce unmatched quality and precision. And that's why you should move quickly to be a part of what is now being called the Holy Grail for green energy.

Listen, I wouldn't waste your time with a company that didn't have a lot of room to run or without a specific catalyst to get it moving. Well, this company's potential is threefold...

First, its technology is light-years ahead and the only one of its kind... Second, the world is swimming in garbage and this company will receive the world's garbage for free and in most cases get paid to take it. Third, it's sitting quietly in front of a global multi trillion-dollar tsunami *The Wall Street Journal* calls "a major win for the high-tech industry." And the world's buried treasure!

In fact, every one of the industries that rely on this company's technology -- energy, aerospace, and construction -- is projected to see demand for its products skyrocket in the coming years. Thanks to a phenomenon that will play out by the end of 2009.

So what's this "economic force" that's driving all this new business?

It's none other than **President Obama's stimulus**. Now, whether you support the president's policies or not, there is a ton of money to be made from playing the \$787 billion stimulus the right way.

Unfortunately, most people don't know the difference between a government bailout and a stimulus. They just see politicians emptying the Treasury to line the pockets of bankrupt automakers and banks.

promoters of world power and green technologies

But Obama's stimulus isn't a *bailout*. It's a pure investment in America, designed to keep America on top of the food chain as the world leader in technology and innovation.

When you think about it, it's not all that different from how Ronald Reagan's economic stimulus of the 1980s won the Cold War. This time around, Obama's stimulus is designed to help America win the global *technology* war.

And here's the best part for investors like us: Less than 1% of this massive investment has been paid out. Leaving the door wide open for you to invest in this company and achieve financial freedom. But a word of warning,

## Time is running out

On Monday, June 8, 2009, President Obama vowed to "accelerate spending billions of dollars in stimulus funds and create 600,000 jobs" by summer's end. Meaning billions of stimulus funds could flood the economy before Congress adjourns on October 30, 2009.

And the company we're discussing today is in the perfect position to cash in. Because it dominates the market in the 3 high-tech trends that are guaranteed to heat up once the stimulus cash comes rolling in. Have a look...

- **High-tech Trend No. 1 -- The Next Great Jet Age:** United Airlines, British Airways, and all the world's largest carriers are racing to place orders for Boeing's 787 Dreamliner and Airbus's mega-jet, the 380. These new, state-of-the-art jets will transform air travel -- cutting travel times and using less fuel (*lowering ticket prices for you and me.*) And this company profits no matter what. Because it owns the technology that BOTH of these planes use to fly faster and more efficiently. Plus, thanks to Obama's stimulus plan, the aerospace sector is set to soar. Cities like, St. Louis, Phoenix, and Washington D.C., are expanding their airports with stimulus cash... increasing their efficiency and capacity. That means increased flights and of course more passengers and planes!
- **High-tech Trend No. 2 -- The Coming Energy Spike:** President Obama is pouring an estimated \$50 billion of his stimulus package into "Repowering America" -- building new power plants and making existing ones more efficient... and this company is primed to scoop up the majority of the new business. Because it's a leader in efficient, next-generation power plant technology. From natural gas turbines to tubing for deep-sea oil platforms as well as parts for coal and nuclear power plant parts and even state-of-the-art pollution controls.
- **High-tech Trend No. 3 -- The Infrastructure Boom:** This manufacturer supplies more than 5,000 customers with a diversified number of high-performance metal alloys. Including complex systems and parts for utilities and smart grids. Plus, this company also forges industrial tools that are lighter, stronger, and more reliable than those of the competition. Giving it a unique edge once Congress unleashes billions from the stimulus plan to rebuild America and fix our ailing infrastructure.

promoters of world power and green technologies

You're right to ask... How can one company profit from all these sectors? Is it some sort of conglomerate?

Quite the contrary, it's a relatively small company. And that's why it's been flying under the radar of Wall Street for so long. But industry insiders know it well.

And make no mistake, when it comes to the mission-critical technology we've just discussed, switching suppliers is costly... and also very risky.

It's why you won't see this company losing business to China. There's simply no room for gambling on complex, critical components like the landing gears of a jet... engine parts for Navy warships... and metal alloys that can stand up to 2,400F of heat...

As a result, this company has clawed its way into thousands of companies' supply chains -- practically guaranteeing itself continued business for life!

I can't wait to give you this company's name -- all the important details and how much you can hope to make when it takes off -- The name of the company is spectrum blue steel corporation registered with the S.E.C of the Philippines. You can see more about this company by simply going to the **True Green Energy** Web Site at [www.tgeg.asia](http://www.tgeg.asia)

Truth is, we are way *ahead* of our time! Yes, you read that right. We are ahead of our time. And have an invention that takes care of the stifling air pollution and poisoned water supplies and creates clean green energy from municipal waste and garbage of most any kind.

Please allow me a proper introduction. My name is **Ronald Flynn** and as the C.E.O of **True Green Energy Group** and I'm a dedicated investor and member of a unique group of individual investors who have invested in **Spectrum Blue Steel** corporation because they have the license to a new invention called the Biosphere MKV that can clean up the worlds dump sites and landfills and produce clean green electricity without any harmful emissions to the planet while cashing in on trillions of dollars that can be made by the global deployment of these machines.

**TGEG** is always looking for those rare investments that change lives. The stocks that will be talked about decades and **Spectrum Blue Steel** is that company! I sincerely Hope you take advantage of this opportunity and I hope your life is full of green opportunities as our planet needs all the help it can get.

To find out more please go to our web site at [www.tgeg.asia](http://www.tgeg.asia) or call our corporate offices to speak with one of our associates and or a green biosphere specialist who can help you become a new partner in **SBS** today.

Regards,  
**Ronald Flynn**
